Severe Palmar Hyperhidrosis treated by Transthoracic Endoscopic Sympathectomy

The manuscript by William Lau, Jeffrey Lee, Collin Dang, and Lorrin Lee deals with a unique surgical procedure to help the "quality of life". The authors performed the procedure on only eight patients to date, and despite some adverse effects of the surgery, all patients reported an improvement in their "quality of life".

This severe form of palmar hyperhidrosis is not just seen in the dermatologist’s office. All physicians encounter patients with this sweating in extremus of the hands. Estimates of this condition range from 0.6-1% of the population.

It must be emphasized that transthoracic endoscopic sympathectomy should never be considered first-line treatment for palmar hyperhidrosis.

Most people who have hyperhidrosis are treated with conservative less aggressive methods, including:

Continued on p. 129
Topical Antiperspirants

Antiperspirants, usually applied to the axillae, may also work on the palms. While these products help to varying degrees from most published studies dealing with sweating of the axillae, a trial of a product like Procter & Gamble’s Secret Platinum Protection might be considered. The efficacy of topical antiperspirants drug systems reported by the U.S. Food and Drug Administrations OTC Antiperspirants Review Panel ranged from 14 - 70% for axillary sweating. Palmar sweating was not studied.

Many OTC products contain aluminum chlorohydroxide. Some, like Certain Dri, contain aluminum chloride. Prescription products include Drysol which is a 20% aluminum chloride solution in alcohol. Gluteraldehyde and formaldehyde have also been used.

Electric devices

A home ioniophoresis Dryonic is available by prescription from General Medical Corp, Los Angeles, California. This is a battery device supplying galvanic current to the palms, soles or axillae.

Oral medications

Over the years many oral preparations have been used. Anticholinergics such as Pro-Banthis, liquid forms of atropine such as tincture of belladonna, and various tranquilizer/anticholinergic such as Atarax have been used with varied results.

Injection Therapy

There has been some recent interest in Botulinum toxin (Botox) injections for hyperhidrosis. Multiple Botox injections into the palms are required. Problems include pain and burning, weakness of small hand muscles and short duration of effect. This is an off-label use of Botox.

Surgical procedures

Excision of axillary sweat glands has also been done, but obviously not for palmar sweating. Dorsal sympathectomy has been a common procedure but because of complications including 50% regrowth of nerves is done less today.

For several years we had to refer patients to the mainland or to Sweden to obtain this surgery. Drott and associates in Boras, Sweden treated 850 patients and reported their findings in 1995. With the worldwide general acceptance of transthoracic endoscopic sympathec-
500-1000 mg initially, then 500 mg q 8 hr
• ACTH 40 units IM q 6-12 hours
• Prednisone 20-40 mg daily or equivalent IM or IV

Suppression of Crystal-induced Inflammation
• Joint aspiration or lavage and injection of corticosteroid
• IV colchicine 1 mg in 20 ml normal saline over 10-20 minutes; may repeat once. Do not infiltrate. Avoid if renal or hepatic failure.

Prevention of Intercritical Gouty Attacks
• After initial response, doses can be tapered off over 7-10 days
• Then maintain on prophylactic colchicine 0.6 mg once or twice a day to prevent recurrent attacks
• If colchicine not tolerated, may use an NSAID
• Decreases frequency of gouty attacks about 50%

Colchicine Prophylaxis for Pseudogout

• Randomized, 1 year study

Colchicine
• Alkaloid extract of colchicum autumnale; meadow saffron
• Interferes with microtubules of neutrophils to inhibit motility, chemotaxis, and chemotactic factor release at therapeutic concentrations
• Higher concentrations arrest cell division among leucocytes
• Uniquely effective for acute gout

Colchicine Metabolism
• Rapidly absorbed; to 50% protein bound;
• Concentrates in leukocytes; binds to tubulin
• Plasma half-life 20 min, but present in leukocytes for 2-3 days and still measurable 10 days later
• Excreted in bile, feces and urine

Colchicine Toxicity
• Minimal with usual doses of 0.6 to 1.2 mg daily
• D. abdominal cramping, N. V.: common with oral dosing
• Chronic higher doses: cytopenias, peripheral neuritis, hair loss, amenorrhea, oligospermia, myopathy
• Overdoses: severe hemorrhagic gastroenteritis, renal failure, hepatic failure, seizures
• Fatal dosages as low as 7 mg; >40 mg usually fatal

Frequent Mistakes in Management of Gout
• Forget to aspirate joint or tophus to establish Dx
• Forget to treat both inflammation and hyperuricemia
– NSAIDs and colchicine have no effect on serum or tissue urates
– Allopurinol and probenecid are not analgesic or anti-inflammatory
• Forget that successful treatment must continue forever
• Confuse chronic polyarticular tophaceous gout with RA

(88%) that tailored materials were rated more favorably than standard materials, and that the tailored materials group reported improved sunscreen habits (p<.05), greater perceived benefits of sun protection (p<.05), and trends toward improved knowledge, more adequate sunscreen application, and higher perceived risk for skin cancer.

The month of May includes observances of Skin Cancer Awareness Month and National Melanoma/Skin Cancer Prevention and Detection Month. The Hawaii Skin Cancer Coalition, a statewide organization of health professionals, agencies, and consumers provides increased public education on skin cancer prevention. Skin cancer prevention research will continue to be an area of particular emphasis at the Cancer Research Center of Hawaii. For more information, please visit the website of the Cancer Research Center of Hawaii (www.crch.org).

tomy and its availability now a in Hawaii, our patients with severe sweaty palms have another effective treatment available.

Why “Watch the Wasabe”? Most people in Hawaii, and indeed around the world, now know to watch the Wasabe and not eat it all at once. In a letter to the editor “Horseradish Horrors: Sushi Syncope” in the Journal of the American Medical Association, a 63-year-old man ate the whole (glob) of wasabe at his first Japanese meal and had vasomotor near-collapse. Among his many symptoms was severe diaphoresis not merely palmar hyperhidrosis

In summary, try conservative methods to treat your severe palmar sweating patients, but because it does impact positively on their quality of life consider referral for transthoracic endoscopic sympatheticectomy and... watch the wasabe.
