Editor, Hawaii Medical Journal

Resumption of Individual Manuscripts

Our numerous “Special Issues” have backlogged the excellent individual manuscripts awaiting publication.

In this issue, we present the United Kingdom Diabetes Study, which might well be published in Lancet or the New England Journal of Medicine, but because of the incidence of diabetes mellitus in Hawaii especially in our native Hawaiians, we are pleased to feature this paper. Mahalo to Doctors Beddow, Arakaki, and Srimanuthiphol for their report.

Lt. Col. Michael Sawyer and his associates in the Surgery Department at Tripler have submitted a very concise manuscript on the Cell Cycle. As you will discover, much has occurred since some of us attended Medical School pertaining to molecular biology research. The recently held seminar on genetics and molecular biology sponsored by Queen’s Medical Center, the Ohio State University and National Cancer Institute, held here in Hawaii in February 1999, attested to the quantum leap in genetics findings. The Cell Cycle manuscript by Sawyer et al is reader friendly, containing both theoretical and practical information.

Our final manuscript, presented by fourth-year medical student Lisa Hui and her preceptor Dr. Jinichi Tokeshi is the case report of a man with severe meningococcal meningitis treated with antibiotics plus dexamethasone. Mahalo, Dr. Tokeshi and Ms. Hui, for their interesting submission.

The Role of Family Practice in Medical School Education

Kay A. Bauman, MD, MPH
Interim Co-Chair, Department of Family Practice and Community Health
John A. Burns School of Medicine, University of Hawaii at Manoa

In February, 1993, the Liaison Committee on Medical Education (LCME) endorsed a document giving family medicine its necessary place in medical education. For the first time the Committee stated: “All schools must provide broad-based clinical education programs that equip students with the knowledge, skills, attitudes and behaviors necessary for further training in the practice of medicine. Instruction and experience in patient care must be provided in both ambulatory and hospital settings. All schools must offer a core curriculum in primary care, utilizing the disciplines or multi-disciplinary approaches involved in the delivery of such care. Clinical education programs involving patients should include disciplines such as family medicine, internal medicine, obstetrics and gynecology, pediatrics, psychiatry and surgery. Schools that do not require clinical experience in one or another of these disciplines must ensure that their students possess the knowledge and clinical abilities to enter any field of graduate medication education.”

This document culminated a 10-year process that coincided with increased public demand for more broad-based physicians available to the American public for primary care.

The W.K. Kellogg Foundation conducted a health care consumer poll in 1994 looking at attitudes toward the delivery of health care in local communities and how these same consumers interact with the health care system. The summary of findings showed an overwhelming belief that the American public should make more use of family doctors (84%) rather than medical specialists (50%). They also supported the government spending its training money either equally on the training of generalists and specialists (46%) or that the government should double spending on training generalists over specialists (33%). These same consumers were more likely to turn to generalists (48%) rather than specialists (29%) to meet their health care needs; for family members the comparative numbers were 59% saw generalists and 28% specialists.

The public demand for more generalists has been going on for some time. It has resulted in Family Practice being established as a specialty in the 1960’s culminating in the establishment of the American Board of Family Practice in 1969, which then administered its first certifying exam in 1970. It mandated recertification from the beginning! Although initial requirements to sit for the Boards did not mandate a 3-year residency, rather required at least 3 years of practice and 50 Continuing Medical Education (CME) credits annually, the Board allowed no one to “grandfather” in. All had to take the certifying exam. Since 1978, a 3-year FP residency has been required to sit for Boards. In the U.S., 10 of 125 medical schools still do not have departments of Family Medicine, although...
all states now have Family Practice Residencies. Fifteen medical schools do not require training in Family Practice.

The John A. Burns School of Medicine, although a relatively young medical school, did not begin with a Family Practice department. For many years it centered clinical training around the 5 disciplines of internal medicine, obstetrics and gynecology, pediatrics, psychiatry and surgery. Under the leadership of Dean Christian Gulbrandsen, M.D., a department was established in 1992. From the beginning, the department took on a 2-fold task: (1) establishing a required 3rd year clinical clerkship that had parity with other clerkships, and (2) establishing a Family Practice residency program. Both goals were met in late June 1994! Since the Class of 1996, all JABSOM graduates have experienced 7 weeks of ambulatory Family Practice training in their third year, equal in length to their training in obstetrics and gynecology, pediatrics, psychiatry and surgery. This exposure to and experience with family physicians and family practice education has changed the specialty choice of JABSOM graduates from an average of 3% per year for years 1988 to 1992 to

The JABSOM Family Practice residency has graduated 23 family physicians, all but 3 of whom practice in Hawaii or the Pacific Basin, and will graduate 6 more this year. Fifteen practice in rural or underserved areas of Hawaii or in the Pacific Basin.

The Family Practice clerkship emphasizes ambulatory or outpatient teaching. Students rotate with community family physicians who in addition to providing competent comprehensive care to their patients take on this teaching role. These physicians see patients of all ages from newborn to the elderly, emphasize caring for families, and teach additional skills stressed in FP training that may be overlooked in other primary care disciplines. For example, students (and residents) are expected to learn/master a significant amount of skill in outpatient gynecology, dermatology, sports medicine, and office orthopedics. Training brings attention to the doctor-patient relationship, both during clinical encounters, and in required seminars. Hawaii’s diverse ethnic and cultural environment requires that students gain knowledge and skills in cross-cultural communication and understanding. Family physicians routinely care for depressed persons, anxious persons, persons who have experienced abusive or violent relationships, and persons with addiction problems, to alcohol, street drugs or nicotine. Family physicians, and thus training environments, emphasize prevention: simple things such as immunizations (flu shots, pneumonia and varicella vaccines); contraception; screening for colon, cervical, breast and prostate cancers; and an emphasis on cardiovascular health that addresses regular exercise, healthy eating habits, evaluation of cholesterol levels and consideration of family risk history.

A primary care physician often is the steersman for a patient
